**Criminality in the Netherlands**

# Design (week 2)

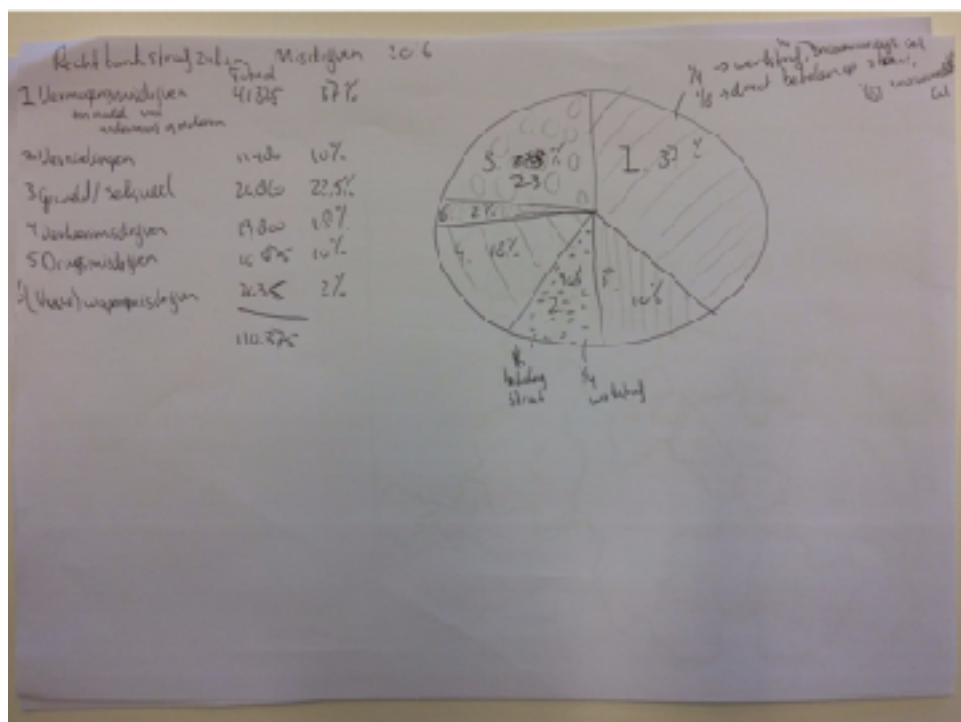

By Najib, Dewi, Alwan and Marc

This (top bar chart) is suspects of crimes in 2017. On the y-axis you can read the amount of suspects, x-axis their age groups. Most are between 25-45.

This is about criminals, and their backgrounds. There is a difference between autochtonen and allochtonen (which is separated between western and non-western as well).

When we zoom in on the breakdown of non-western allochtonen, we see that Moroccans, Turks and Surinamese people have the highest share in the total crime of this group.

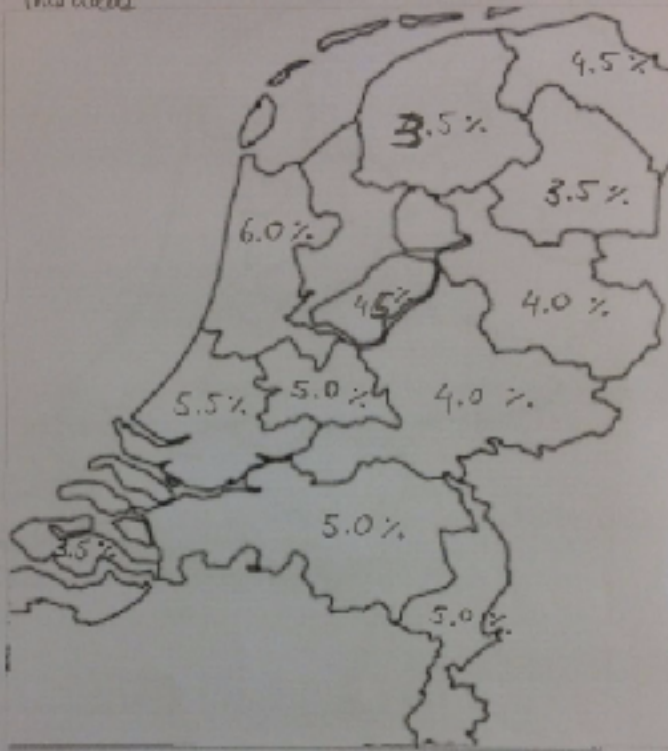

This second image is about all crimes committed, and what kind.

Theft has the biggest share in this chart.

This image is about the feeling of unsafety, per province. The differences between the provinces aren't huge, with the biggest difference (between Zeeland and Limburg) being 10%.

misdaad

Murders, looked at per province. This highest percentages are in the Randstad, which is where most people live.

misdriven  
% bevolking

percentage misdadigers  
per provincie
